

Java Arrays :-

- Array is an object which contains elements of a similar data type.
- The elements of an array are stored in a contiguous memory location. We can store only a fixed set of elements in a Java array.
- Array in Java is index based, the first element of the array is stored at the 0th index, 2nd element is stored on 1st index and so on.
- To declare an array, define the variable type with

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|---------------|
| 44 | 53 | 65 | 17 | 22 | 46 | 39 | 71 | 89 | |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | ← Array index |

Array length = 9

first index = 0

last index = 8

* Array Declaration:-

- In Java, here is how we can declare an array:-

```
datatype[] arrayRefVar;
```

- datatype.it can be primitive data types like int, char, double.
- arrayRefVar.it is an identifier

For example:-

```
double[] myList;
```

Here, mylist is an array that can hold values of type double.

* Array Initialization:-

- In Java, we can initialize arrays during declaration.

```
int[] age = {12, 4, 5, 2, 5};
```

- Here, we have created an array named age. and initialized it with the curly brackets.

- In the Java array, each memory location is associated with a number. array.
- The number is known as an index.
- We can also initialize arrays in Java, using the index number.

for example:-

```
int [ ] age = new int [5];
//initialize array
age[0] = 12;
age[1] = 4;
age[2] = 5;
age[3] = 2;
age[4] = 5;
```

| age[0] | age[1] | age[2] | age[3] | age[4] |
|--------|--------|--------|--------|--------|
| 12 | 4 | 5 | 2 | 5 |

Java Arrays initialization.

→ first element of an array is at index 0.

→ If the size of an array is n , then the last element of the array will be at index $n-1$.

* Creating Arrays:-

- you can create an array by using the new operator the following Syntac.
- To define the number of elements that an array can hold, we have to allocate memory for the array in Java.

```
double [] data;
```

```
data = new double [10];
```

- Array can store 10 elements. we can also say that the size or length of the array is 10.

for example:-

```
double [] data = new double [10];
```

* Access Elements of an Array:-

- Once the array is created, you can access an array element by using the name of the array followed by an index enclosed between a pair of square brackets.

Example:-

```
-- class Demo
```

```
    { Public static void main (String [] args) {
```

```
        int [] num = new int [5];
```

```
        num[0] = 5;
```

```
        num[1] = 10;
```

```
        num[2] = 25;
```

```
        System.out.println ("num[0]" + num[0]);
```

```
        System.out.println ("num[1]" + num[1]);
```

```
        System.out.println ("num[2]" + num[2]);
```
