

Python Comments

- In Python, we use the hash (#) symbol to start writing a comment.
- Comments are for programmers to better understand a program.
- Python interpreter ignores comments.

Example:-

```
# This is a comment  
# print out Hello  
print('Hello')
```

- Multi-line comments

we can have comments that extend up to multiple lines.

One way is to use the hash (#) symbol at the beginning of each line.
for example:

```
# This is long comment  
# and its extends  
# to multiple lines
```
